

## ABSTRACT

5      A power strip includes two or more spaced-apart sockets each having a set of terminal insertion holes for insertion of plug terminals of a power cable or the like and either at least one flexible joint that interconnects adjacent sockets or a flexible cover of substantially tubular shape that substantially covers and interconnects the sockets. The interconnection of the sockets by the flexible joints or the flexible cover enables the spaces between adjacent sockets to be optimized for the types and numbers of plugs, AC adapters and the like to plugged into the sockets
